Class15

Jaquish (PID: A59010386)

11/17/2021

Background

Today we examine a published RNA-seq experiment where airway smooth muscle cells were treated with dexamethasane, a synthetic glucocorticoid steroid with anti-inflammatory effects. (Himes et al. 2014)

Load the contData and colData

We need 2 things - 1: count Data - 2: colData (the metadata that tells us about the design of the experiment)

```
counts <- read.csv("airway_scaledcounts.csv", row.names=1)
metadata <-  read.csv("airway_metadata.csv")
```

```
#head(counts)
```

```
head(metadata)
```

```
##           id     dex celltype     geo_id
## 1 SRR1039508 control   N61311 GSM1275862
## 2 SRR1039509 treated   N61311 GSM1275863
## 3 SRR1039512 control  N052611 GSM1275866
## 4 SRR1039513 treated  N052611 GSM1275867
## 5 SRR1039516 control  N080611 GSM1275870
## 6 SRR1039517 treated  N080611 GSM1275871
```

Side note: Let's check the correspondence of the metadata and count data setup.

```
metadata$id
```

```
## [1] "SRR1039508" "SRR1039509" "SRR1039512" "SRR1039513" "SRR1039516"
## [6] "SRR1039517" "SRR1039520" "SRR1039521"
```

```
colnames(counts)
```

```
## [1] "SRR1039508" "SRR1039509" "SRR1039512" "SRR1039513" "SRR1039516"
## [6] "SRR1039517" "SRR1039520" "SRR1039521"
```

We can use '==' thing to see if they are the same

```
metadata$id == colnames(counts)
```

```
## [1] TRUE TRUE TRUE TRUE TRUE TRUE TRUE TRUE
```

Checks to see if everything is what you thought, in this case confirming there are no falses.

```
all( c(T,T,T,F))
```

```
## [1] FALSE
```

Compare control to treated

First we need to access all the controls columns in our counts data.

```
control.inds <- metadata$dex == "control"
control.ids <- metadata[ control.inds,]$id
```

Use these ids to access just the control columns of our 'counts' data

```
head(counts[ , control.ids])
```

```
##                 SRR1039508 SRR1039512 SRR1039516 SRR1039520
## ENSG00000000003        723        904       1170        806

```

```
treated.mean <- rowMeans(counts[ , treated.ids])
head(treated.mean)
```

```
## ENSG00000000003 ENSG00000000005 ENSG00000000419 ENSG00000000457 ENSG00000000460
##          658.00            0.00          546.00          316.50           78.75
## ENSG00000000938
##            0.00
```

```
meancounts <- data.frame(control.mean, treated.mean)
```

There are 38694 rows/genes in this dataset.

```
nrow(counts)
```

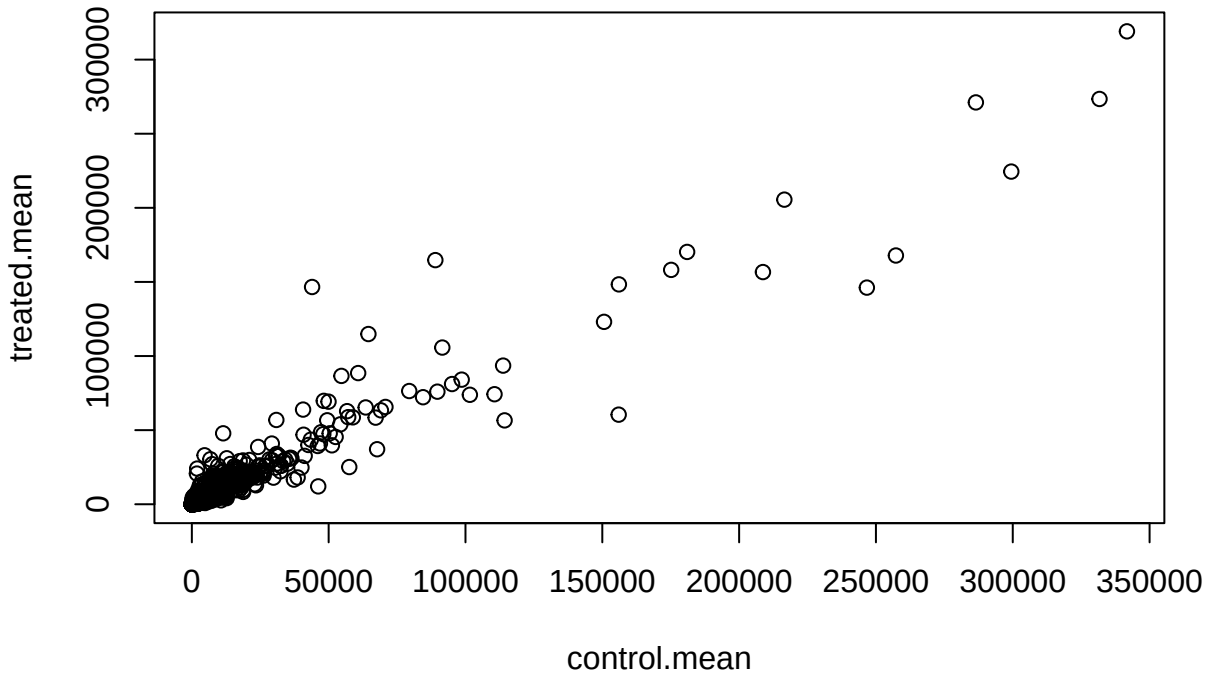
```
## [1] 38694
```

Q1. 38,694 genes

Compare the control v. treated

A quick plot of our progress so far.

```
plot(meancounts)
```



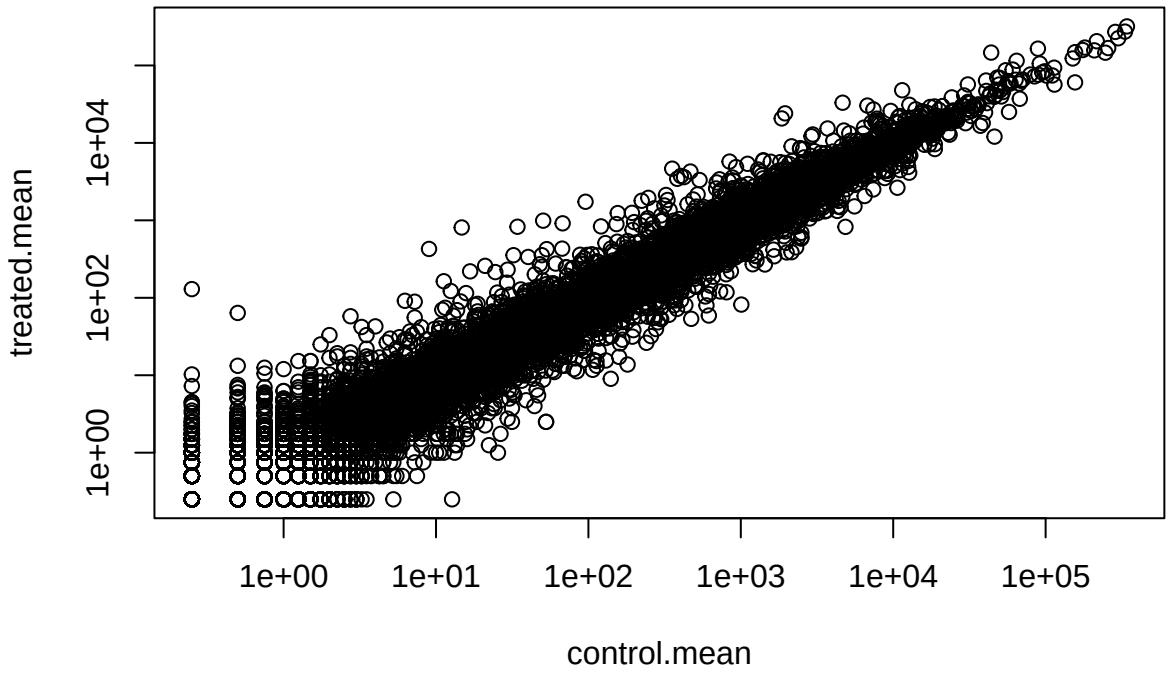
Each dot is a gene. Dots along the linear diagnol see no expression change. Below the diagnol is negative, above positive/increased in treated.

This would benefit from a log transform! Let's plot on a log sclae

```
plot(meancounts, log="xy")
```

```
## Warning in xy.coords(x, y, xlabel, ylabel, log): 15032 x values <= 0 omitted
## from logarithmic plot
```

```
## Warning in xy.coords(x, y, xlabel, ylabel, log): 15281 y values <= 0 omitted
## from logarithmic plot
```



We often use log transformations to make data more comprehensible/sensible.

```
log2(40/20)
```

```
## [1] 1
```

Fold change of 1 if the treatment doubled in expression.

```
log2(10/20)
```

```
## [1] -1
```

Fold change of -1 if the treatment expression decreased to half of control.

Cool, lets calculate the fold change of our control v. treated.

```
meancounts$log2fc <- log2(meancounts[,"treated.mean"]/meancounts[,"control.mean"])
head(meancounts)
```

```
##                 control.mean treated.mean      log2fc
## ENSG00000000003       900.75       658.00 -0.45303916
## ENSG00000000005         0.00         0.00         NaN
## ENSG00000000419       520.50       546.00  0.06900279
## ENSG00000000457       339.75       316.50 -0.10226805
## ENSG00000000460        97.25        78.75 -0.30441833
## ENSG00000000938         0.75         0.00        -Inf
```

We need to drop the zero count genes/rows..

```
head(meancounts[,1:2] == 0)
```

```
##                 control.mean treated.mean
## ENSG00000000003        FALSE        FALSE
## ENSG00000000005         TRUE         TRUE
## ENSG00000000419        FALSE        FALSE
## ENSG00000000457        FALSE        FALSE
## ENSG00000000460        FALSE        FALSE
## ENSG00000000938        FALSE         TRUE
```

The `which()` function tells us the indices of TRUE entries in a logical vector.

```
which( c(T,F,T))
```

```
## [1] 1 3
```

For our case we don't want to know the True positions within the vector, we want to know which rows have True.

```
inds <- which(meancounts[,1:2] == 0, arr.ind=TRUE)
head(inds)
```

```
##                 row col
## ENSG00000000005   2   1
## ENSG00000004848  65   1
## ENSG00000004948  70   1
## ENSG00000005001  73   1
## ENSG00000006059 121   1
## ENSG00000006071 123   1
```

I only care about the rows here (if there is a 0 in any column I will exclude this eventually)

```
to.rm <-  unique(sort(inds[, "row"]))
head(meancounts[-to.rm])
```

```
##                 control.mean      log2fc
## ENSG00000000003       900.75 -0.45303916
## ENSG00000000005         0.00         NaN
## ENSG00000000419       520.50  0.06900279
## ENSG00000000457       339.75 -0.10226805
## ENSG00000000460        97.25 -0.30441833
## ENSG00000000938         0.75        -Inf
```

```
mycounts <- meancounts[-to.rm,]
```

We now have 21817 genes remaining.

```
nrow(mycounts)
```

```
## [1] 21817
```

Fold-change threshold of +2 or greater?

```
sum(mycounts$log2fc > +2)
```

```
## [1] 250
```

What percentage is this?

```
round((sum(mycounts$log2fc > +2) / nrow(mycounts)) *100, 2)
```

```
## [1] 1.15
```

```
sum(mycounts < -2)
```

```
## [1] 367
```

```
library(DESeq2)
```

```

```

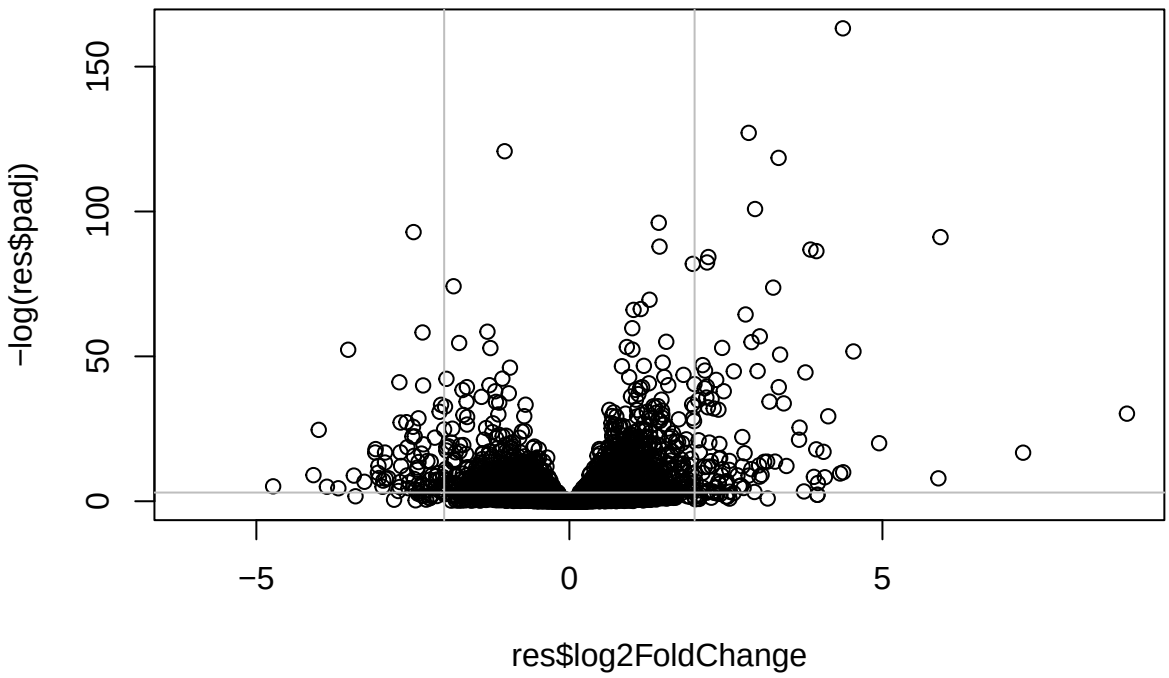
Focus on the genes with a good p-value(low): plot the p-value against the log2 with volcano plot

A Volcano Plot

This is a very common data viz of this type of data that does not really look like a volcano.

```
plot(res$log2FoldChange, -log(res$padj))
abline(v=c(-2,2), col="gray")
abline(h=-log(0.05), col="gray")
```



Adding annotation data

We want to add meaningful gene names to our dataset to determine which are up/down most significantly.

For this we will use 2 bioconductor packages, one does the work and is called AnnotationDbi the other contains the data we are going to map between and is called "org.Hs.eg.db"

```
BiocManager::install("org.Hs.eg.db") BiocManager::install("AnnotationDbi")
```

```
library("AnnotationDbi")
```

```
## Warning: package 'AnnotationDbi' was built under R version 4.1.2
```

```
library("org.Hs.eg.db")
```

```
##
```

```
columns(org.Hs.eg.db)
```

```
##  [1] "ACCNUM"       "ALIAS"        "ENSEMBL"      "ENSEMBLPROT"  "ENSEMBLTRANS"
##  [6] "ENTREZID"     "ENZYME"       "EVIDENCE"     "EVIDENCEALL"  "GENENAME"
## [11] "GENETYPE"     "GO"           "GOALL"        "IPI"          "MAP"
## [16] "OMIM"         "ONTOLOGY"     "ONTOLOGYALL"  "PATH"         "PFAM"
## [21] "PMID"         "PROSITE"      "REFSEQ"       "SYMBOL"       "UCSCKG"
## [26] "UNIPROT"
```

Here we map to "SYMBOL" the common gene name that the world understands and wants.

```
res$symbol <- mapIds(org.Hs.eg.db,
                     keys=row.names(res),
                     keytype="ENSEMBL",
                     column="SYMBOL",
                     multiVals="first")
```

```
## 'select()' returned 1:many mapping between keys and columns
```

```
head(res)
```

```
## log2 fold change (MLE): dex treated vs control

```

The above genes are in Entrez format.

Before we can use KEGG we need to get our gene identifiers in the correct format for KEGG, which is ENTREZ format in this case.

```
head(rownames(res))
```

```

                     multiVals="first")
```

```
## 'select()' returned 1:many mapping between keys and columns
```

The main gage() function requires a named vector of fold changes, where the names of the values are the Entrez gene IDs.

Note that we used the mapIDs() function above to obtain Entrez gene IDs (stored in res$entrez) and we have the foldchanges result

```
foldchanges = res$log2FoldChange
```

```
names(foldchanges) = res$entrez
head(foldchanges)
```

```

The pathway() function will add out genes to a KEGG pathway as colored entries:

```
pathview(gene.data=foldchanges, pathway.id="hsa05310")
```

```
## 'select()' returned 1:1 mapping between keys and columns
```

```
## Info: Working in directory /Users/abigailjaquish/Documents/Bioinformatics/R/BGGN213_github/class15
```

```
## Info: Writing image file hsa05310.pathview.png
```

1. Data import/read countdata coldata(metadata)
2. PCA (QC) if happy then...
3. Deseq analysis (DESeq() function)
4. Figures: Volcano Plot (ggplot or plot function)
5. Annotation (use biology to understand the up/down regulated) KEGG, GO, etc.
6. Pathway Analysis (gage() function)
